

Milnor has a better solution through dilution.

When Milnor introduced PulseFlow® technology, CBW® washing was thrust into the future. The idea of balancing time, temperature, mechanical action and chemistry was missing one critical piece of the pie – DILUTION through the efficient use of water.

PulseFlow combines the innovative RecircONE® fast wet down and chemical immersion in the first module with standing bath washing in every spacious process module. Thorough and efficient dilution occurs by way of intermittent high velocity counterflow rinsing and traditional True Top Transfer.

The result is hygienically clean linen using less water (as low as 0.3 gallons per pound/2.5 liters per kilogram) and less energy as proven time and again by hundreds of PulseFlow tunnels in a variety of laundry applications worldwide.
